Re: *TeraExchange, LLC – Regulation 40.2 Certification of USD LIBOR vs NZD BBR-FRA Basis Swaps*

Ladies and Gentlemen:

TeraExchange, LLC (“TeraExchange”) hereby notifies the Commodity Futures Trading Commission (the “Commission”) of its intent to list United States Dollar (“USD”) LIBOR vs New Zealand Dollar (“NZD”) BBR-FRA Basis Swaps (the “Contract”) on the TeraExchange swap execution facility. TeraExchange intends to list this Contract on December 19, 2022.

Pursuant to Commission Regulation 40.2, this submission includes:

1. A copy of the submission cover sheet in accordance with the instructions provided in Appendix D to Part 40 of the Commission’s regulations, attached as Exhibit A.
2. The intended listing date is December 19, 2022.
3. A certification by TeraExchange that (a) the Contract complies with the Commodity Exchange Act, as amended (the “Act”), and the Commission regulations thereunder; and (b) concurrent with this submission, TeraExchange posted on its website (i) a notice of pending certification of the Contract and (ii) a copy of this submission, attached as Exhibit B;
4. The Contract’s terms and conditions, attached as Exhibit C; and
5. An explanation and analysis of the Contract’s compliance with applicable core principles and Commission regulations, attached as Exhibit D.

Questions regarding this submission should be directed to Todd Langdon, Chief Compliance Officer, at 908-273-8277 or by e-mail at tlangdon@teraexchange.com.

Sincerely,

Christopher Rossman
Christopher Rossman
Chief Operating Officer

EXHIBIT C

Terms and Conditions

USD LIBOR vs NZD BR-FRA BASIS IRS	
General	
Swap Structure	A fixed notional, float for float Interest Rate Swap whose value is based upon the difference between a stream of floating interest payments that are tied to a floating reference rate, over a term to maturity.
Currency	NZD
Quoting Convention	Spread over Floating Leg 1 (000.0)
Price Increment	0.001 points = 0.1 basis points
Minimum Notional Size	NZD 1,000.00
Minimum Notional Size Increment	NZD 1,000.00
Trading Conventions	Buy = Pay Spread Sell=Receive Spread
Trading Hours	00:01 - 24:00 Sunday - Friday (Eastern Time)
Last Trade Day	Available to trade on every US business day
Effective Date	The Effective Date is the first date for which fixed and floating payments accrue. For spot starting instruments, the Effective Date is the Trade Date. For forward starting instruments, the Effective Date is Trade Date + Forward Starting Period, subject to adjustment based on Modified Following convention.
Maturity Date	The Maturity Date (also referred to as the Termination Date) is the final date to which fixed and floating amounts accrue. For spot starting instruments, this date is Effective Date + Tenor.
Forward Starting Date	As agreed by the counterparties
Tenor	As agreed by the counterparties
Upfront Payment	Standard: None
Block Size	As set forth in Appendix F to Part 43 of the CFTC Regulations
Settlement Procedure	Bilateral settlement, as agreed by the counterparties
Position Accountability	As may be determined and published by TeraExchange under CFTC Regulation 37.600 (c)
Float Leg 1	
Reset Frequency	1 Month, 3 Month
Payment Frequency	1 Month, 3 Month
Compounding	None
Day Count Convention	ACT/360
Business Day Convention	Modified Following
Reset Dates	Reset Dates define the beginning and end of accrual periods. Floating Rate Reset Dates facilitate the determination of the Reference Rate Fixing Dates. Each Reset Date is subject to adjustment based on Modified Following.
Fixing Date	Wellington Business Day that coincides with the Reset Date
Floating Rate Index	USD-ICE-LIBOR (3 Month)
Fixing Date Holiday Calendar	New York (USNY), London (GBLO), Wellington (NZWE)
Float Leg 2	
Reset Frequency	1 Month, 3 Month
Payment Frequency	1 Month, 3 Month
Compounding	None
Day Count Convention	Act/365.FIXED
Business Day Convention	Modified Following
Reset Dates	Reset Dates define the beginning and end of accrual periods. Floating Rate Reset Dates facilitate the determination of the Reference Rate Fixing Dates. Each Reset Date is subject to adjustment based on Modified Following.
Fixing Date	Wellington Business Day that coincides with the Reset Date
Floating Rate Index	NZD-BBR-FRA (3 Month)
Fixing Date Holiday Calendar	Wellington (NZWE), Auckland (NZAU)

EXHIBIT D

EXPLANATION AND ANALYSIS OF THE CONTRACT'S COMPLIANCE WITH APPLICABLE CORE PRINCIPLES AND COMMISSION REGULATIONS

As required by Commission Regulation § 40.2(a), the following analysis, in narrative form, demonstrates that the USD LIBOR vs NZD BBR-FRA Basis Swap (the "Contract") is consistent with the requirements of the Commodity Exchange Act, as amended (the "Act"), and the Commission regulations and guidance thereunder (in particular, Appendix B to Part 37 and Appendix C to Part 38).

Appendix B to Part 37

CORE PRINCIPLE 3 OF SECTION 5H OF THE ACT - SWAPS NOT READILY SUSCEPTIBLE TO MANIPULATION; CORE PRINCIPLE 4 OF SECTION 5H OF THE ACT - MONITORING OF TRADING AND TRADE PROCESSING

The swap execution facility shall permit trading only in swaps that are not readily susceptible to manipulation.

(a) *Guidance.*

(1) In general, a swap contract is an agreement to exchange a series of cash flows over a period of time based on some reference price, which could be a single price, such as an absolute level or a differential, or a price index calculated based on multiple observations. Moreover, such a reference price may be reported by the swap execution facility itself or by an independent third party. When listing a swap for trading, a swap execution facility shall ensure a swap's compliance with Core Principle 3, paying special attention to the reference price used to determine the cash flow exchanges. Specifically, Core Principle 3 requires that the reference price used by a swap not be readily susceptible to manipulation. As a result, when identifying a reference price, a swap execution facility should either: Calculate its own reference price using suitable and well-established acceptable methods or carefully select a reliable third-party index.

(2) The importance of the reference price's suitability for a given swap is similar to that of the final settlement price for a cash-settled futures contract. If the final settlement price is manipulated, then the futures contract does not serve its intended price discovery and risk management functions. Similarly, inappropriate reference prices cause the cash flows between the buyer and seller to differ from the proper amounts, thus benefitting one party and disadvantaging the other. Thus, careful consideration should be given to the potential for manipulation or distortion of the reference price.

The reference rates for the floating legs of the Contract include the widely used USD London Interbank Offered Rate ("LIBOR") and New Zealand Bank Bill Benchmark Rate ("BKBM"). The LIBOR and BKBM rates are administered and calculated by regulated third-party providers using specific guidelines as described below.

The Contract is not readily susceptible to manipulation. The Contract trades in a large, well-established and highly liquid market. Price manipulation in such deep markets is exceedingly difficult to achieve. In addition, TeraExchange has established exchange rules and an enforcement infrastructure to prevent manipulation. TeraExchange staff conduct real-time market surveillance and perform comprehensive trade practice and market surveillance compliance review on a T+1 basis.

Calculation of London Inter-Bank Offered Rate (“LIBOR”) - USD

The reference rate for the floating leg of the swap is the United States Dollar London Inter-Bank Offered Rate. LIBOR provides an indication of the average rate at which a LIBOR contributor bank can obtain unsecured funding in the London interbank money market for a given period and in a given currency. Currently, LIBOR is calculated and administered by Intercontinental Exchange, Inc. (“ICE”) via the ICE Benchmark Administration, which maintains a reference panel of between 11 and 16 contributor banks for each currency calculated. Each contributor bank submits input data for all seven LIBOR tenors (Overnight/Spot, One Week, One Month, Two Months, Three Months, Six Months and 12 Months) in each of five fixing currencies (USD, GBP, EUR, CHF and JPY) for which it is on a panel. Contributor bank submissions are based on the lowest perceived rate at which a bank could go to the London interbank money market and obtain funding in reasonable market size, for a given maturity and currency.

Every ICE LIBOR rate is calculated using a trimmed arithmetic mean. Once each submission is received, they are ranked in descending order and then the highest and lowest 25% of submissions are excluded. This trimming of the top and bottom quartiles allows for the exclusion of outliers from the final calculation. The remaining contributions are then arithmetically averaged, and the result is rounded to five decimal places to create an ICE LIBOR rate. This is repeated for every currency and maturity, producing 35 rates every business day. As an administrator that is authorized and regulated by the UK Financial Conduct Authority (the “FCA”), ICE Benchmark Administration is required to comply with the FCA’s rules for benchmark administrators and has been formally assessed in respect of ICE LIBOR against the IOSCO Principles for Financial Benchmarks. The principal committee of the ICE Benchmark Administration is the Oversight Committee, which is responsible for overseeing LIBOR’s methodology and code of conduct. The Oversight Committee has broad market representation, being comprised of representatives from the market, industry bodies, benchmark contributors and infrastructure providers, as well as observers from the Board of Governors of the Federal Reserve System, the Swiss National Bank and the Bank of England. Additional information regarding how ICE LIBOR is calculated, panel composition and governance and oversight of ICE LIBOR may be accessed at <https://www.theice.com/iba/libor>.

Calculation of the New Zealand Bank Bill Benchmark Rate (“BKBM”)

The reference rate for the floating leg of the swap is the Bank Bill Benchmark Rate (“BKBM”), which is the main interest rate benchmark in New Zealand that is designed to reflect the supply and demand for Bank Bills (securities representing short-term debt obligations of a bank with a maturity up to six months) and represents the mid-rates for Prime Bank eligible securities that are traded in the local New Zealand market. BKBM is administered and calculated by the New Zealand Financial Benchmark Facility Limited (“NZFBF”), a subsidiary of the New Zealand Financial Markets Association (“NZFMA”), New Zealand’s professional body for wholesale banking and financial markets that are subject to supervision by either the Reserve Bank of New Zealand or the Financial Markets Authority or as regulated internationally by an equivalent regulatory agency. NZFBF provides transparent governance, oversight and accountability procedures for the BKBM benchmark determination process.

As benchmark administrator, the NZFBF maintains responsibility for all aspects of the capture and calculation process and overall governance surrounding the BKBM. BKBM rates are calculated based on the electronic capture of trade information, or executable bid and offer pricing in the absence of trades, during a daily two-minute trading window. The period of time between 10:20 am and 10:22 am local time is the trading period used for the capture and calculation of BKBM. All NZFMA member organizations that participate in the two-minute trading window are required to adhere to NZFBF’s Bank Bill Benchmark Rate and the BKBM Trading Window Operating Rules & Principles, which can be found at [https://www.nzfbf.co.nz/files/benchmark-documents/bkbm-operating-rules-and-principals---june-2021-\(2\).pdf](https://www.nzfbf.co.nz/files/benchmark-documents/bkbm-operating-rules-and-principals---june-2021-(2).pdf). BKBM is published by the NZFMA at 10:45 am local time each business day, via delayed extract data to the NZFMA website.

(3) For swaps that are settled by physical delivery or by cash settlement refer to the guidance in appendix C to part 38 of this chapter—**Demonstration of Compliance That a Contract is not Readily Susceptible to Manipulation**, section b(2) and section c(4), respectively.

Please see below.

Appendix C to Part 38 - Demonstration of Compliance That a Contract Is Not Readily Susceptible to Manipulation

(c) Futures Contracts Settled by Cash Settlement. (1) Cash settlement is a method of settling certain futures or option contracts whereby, at contract expiration, the contract is settled by cash payment in lieu of physical delivery of the commodity or instrument underlying the contract. An acceptable specification of the cash settlement price for commodity futures and option contracts would include rules that fully describe the essential economic characteristics of the underlying commodity (e.g., grade, quality, weight, class, growth, issuer, maturity, source, rating, description of the underlying index and index's calculation methodology, etc.), as well as how the final settlement price is calculated. In addition, the rules should clearly specify the trading months and hours of trading, the last trading day, contract size, minimum price change (tick size) and any limitations on price movements (e.g., price limits or trading halts).

Essential Economic Characteristics of the Contract Terms

The terms and conditions of the Contract, listed in Exhibit C, follow industry convention and match the terms of basis swaps that are commonly offered in the market.

Calculation of Cash Settlement Price

The Contract is an agreement to exchange cash flow streams by applying two different floating interest rates to a specified notional amount (determined by the counterparties) over a term of maturity (also determined by the counterparties). As such, the cash settlement price will be calculated based on the following variables:

- Floating Leg 1: The payment amount is based on the following: Notional Amount, Payment Frequency, Day Count Convention, Floating Interest Rate Index and Floating Reset Dates.
- Floating Leg 2: The payment amount is based on the following: Notional Amount, Payment Frequency, Day Count Convention, Floating Interest Rate Index and Floating Reset Dates.

All payments are settled in accordance with the payment frequency of the swap. The detailed settlement procedure will be agreed to by the counterparties or determined by the clearing venue.

(2) Cash settled contracts may be susceptible to manipulation or price distortion. In evaluating the susceptibility of a cash-settled contract to manipulation, a designated contract market should consider the size and liquidity of the cash market that underlies the listed contract in a manner that follows the determination of deliverable supply as noted above in (b)(1). In particular, situations susceptible to manipulation include those in which the volume of cash market transactions and/or the number of participants contacted in determining the cash-settlement price are very low. Cash-settled contracts may create an incentive to manipulate or artificially influence the data from which the cash-settlement price is derived or to exert undue influence on the cash-settlement price's computation in order to profit on a futures position in that commodity.

The utility of a cash-settled contract for risk management and price discovery would be significantly impaired if the cash settlement price is not a reliable or robust indicator of the value of the underlying

commodity or instrument. Accordingly, careful consideration should be given to the potential for manipulation or distortion of the cash settlement price, as well as the reliability of that price as an indicator of cash market values. Appropriate consideration also should be given to the commercial acceptability, public availability, and timeliness of the price series that is used to calculate the cash settlement price. Documentation demonstrating that the settlement price index is a reliable indicator of market values and conditions and is commonly used as a reference index by industry/market agents should be provided. Such documentation may take on various forms, including carefully documented interview results with knowledgeable agents.

The Contract operates in a very liquid market with numerous participants. Also, the cash settlement price is not easily susceptible to manipulation or distortion as the method of determining the price is based on factors that are fixed at the start of the particular Contract (i.e., payment frequency, day count conventions and floating reset dates) and USD LIBOR and the BKBM. Additionally, the LIBOR and BKBM reference rates are widely accepted by market participants and readily available through numerous public sources.

(3) Where an independent, private-sector third party calculates the cash settlement price series, a designated contract market should consider the need for a licensing agreement that will ensure the designated contract market's rights to the use of the price series to settle the listed contract.

(i) Where an independent, private-sector third party calculates the cash settlement price series, the designated contract market should verify that the third party utilizes business practices that minimize the opportunity or incentive to manipulate the cash-settlement price series. Such safeguards may include lock-downs, prohibitions against derivatives trading by employees, or public dissemination of the names of sources and the price quotes they provide. Because a cash-settled contract may create an incentive to manipulate or artificially influence the underlying market from which the cash-settlement price is derived or to exert undue influence on the cash-settlement computation in order to profit on a futures position in that commodity, a designated contract market should, whenever practicable, enter into an information-sharing agreement with the third-party provider which would enable the designated contract market to better detect and prevent manipulative behavior.

As described above, the cash settlement price will be calculated through a cash settlement method that is not easily susceptible to manipulation.

(ii) Where a designated contract market itself generates the cash settlement price series, the designated contract market should establish calculation procedures that safeguard against potential attempts to artificially influence the price. For example, if the cash settlement price is derived by the designated contract market based on a survey of cash market sources, the designated contract market should maintain a list of such entities which all should be reputable sources with knowledge of the cash market. In addition, the sample of sources polled should be representative of the cash market, and the poll should be conducted at a time when trading in the cash market is active.

Please see above.

(iii) The cash-settlement calculation should involve computational procedures that eliminate or reduce the impact of potentially unrepresentative data.

(iv) The cash settlement price should be an accurate and reliable indicator of prices in the underlying cash market. The cash settlement price also should be acceptable to commercial users of the commodity contract. The registered entity should fully document that the settlement price is accurate, reliable, highly regarded by industry/market agents, and fully reflects the economic and commercial conditions of the relevant designated contract market.

Please see above.

(v) To the extent possible, the cash settlement price should be based on cash price series that are publicly available and available on a timely basis for purposes of calculating the cash settlement price at the expiration of a commodity contract. A designated contract market should make the final cash settlement price and any other supporting information that is appropriate for release to the public, available to the public when cash settlement is accomplished by the derivatives clearing organization. If the cash settlement price is based on cash prices that are obtained from non-public sources (e.g., cash market surveys conducted by the designated contract market or by third parties on behalf of the designated contract market), a designated contract market should make available to the public as soon as possible after a contract month's expiration the final cash settlement price as well as any other supporting information that is appropriate or feasible to make available to the public.

The USD LIBOR and BKBM reference rates are readily available via a number of public sources. Please see above regarding the calculation of the cash settlement price.

(4) Contract terms and conditions requirements for futures contracts settled by cash settlement.

(i) An acceptable specification of the terms and conditions of a cash-settled commodity contract will also set forth the trading months, last trading day, contract size, minimum price change (tick size) and daily price limits, if any.

Please see Exhibit C for the Contract's terms and conditions.

(A) *Commodity Characteristics*: The terms and conditions of a commodity contract should describe the commodity underlying the contract.

The underlying USD-ICE-LIBOR and NZD-BBR-FRA reference rates are included in the Contract's terms and conditions. These reference rates are widely used in the market and readily available.

(B) *Contract Size and Trading Unit*: An acceptable specification of the trading unit would be a contract size that is consistent with customary transactions in the cash market. A designated contract market may opt to set the contract size smaller than that of standard cash market transactions.

The size of the Contract is consistent with the customary transaction sizes in the market.

(C) *Cash Settlement Procedure*: The cash settlement price should be reliable, acceptable, publicly available, and reported in a timely manner as described in paragraphs (c)(3)(iv) and (c)(3)(v) of this appendix C.

The cash settlement procedure and an explanation of how, in the context of the Contract, it is not readily susceptible to manipulation, is described above.

(D) *Pricing Basis and Minimum Price Fluctuation (Minimum Tick)*: The minimum price increment (tick) should be set a level that is equal to, or less than, the minimum price increment commonly observed in cash market transactions for the underlying commodity. Specifying a futures' minimum tick that is greater than the minimum price increment in the cash market can undermine the risk management utility of the futures contract by preventing hedgers from efficiently establishing and liquidating futures positions that are used to hedge anticipated cash market transactions or cash market positions.

As agreed by the counterparties.

(E) *Maximum Price Fluctuation Limits:* Designated contract markets may adopt price limits to: (1) Reduce or constrain price movements in a trading day that may not be reflective of true market conditions but might be caused by traders overreacting to news; (2) Allow additional time for the collection of margins in times of large price movements; and (3) Provide a “cooling-off” period for futures market participants to respond to bona fide changes in market supply and demand fundamentals that would lead to large cash and futures price changes. If price-limit provisions are adopted, the limits should be set at levels that are not overly restrictive in relation to price movements in the cash market for the commodity underlying the futures contract. For broad-based stock index futures contracts, rules should be adopted that coordinate with New York Stock Exchange (“NYSE”) declared Circuit Breaker Trading Halts (or other market coordinated Circuit Breaker mechanism) and would recommence trading in the futures contract only after trading in the majority of the stocks underlying the index has recommenced.

As agreed by the counterparties.

(F) *Last Trading Day:* Specification of the last trading day for expiring contracts should be established such that it occurs before publication of the underlying third-party price index or determination of the final settlement price. If the designated contract market chooses to allow trading to occur through the determination of the final settlement price, then the designated contract market should show that futures trading would not distort the final settlement price calculation.

The last trading day will be the maturity date of each contract, which is set by the individual counterparties.

(G) *Trading Months:* Trading months should be established based on the risk management needs of commercial entities as well as the availability of price and other data needed to calculate the cash settlement price in the specified months. Specification of the last trading day should take into consideration whether the volume of transactions underlying the cash settlement price would be unduly limited by occurrence of holidays or traditional holiday periods in the cash market. Moreover, a contract should not be listed past the date for which the designated contract market has access to use a proprietary price index for cash settlement.

Payments are settled in accordance with the payment frequency of the Contract. The counterparties determine the payment frequency at the inception of the Contract.

(H) *Speculative Limits:* Specific rules and policies for speculative position limits are set forth in part 150 and/or part 151, as applicable, of the Commission’s regulations.

None required by Parts 150 or 151 of the Commission’s regulations.

(I) *Reportable Levels:* Refer to § 15.03 of the Commission’s regulations.

TeraExchange will adhere to the applicable reporting levels set forth in §15.03 of the Commission’s regulations.

(J) *Trading Hours:* Should be set by the designated contract market to delineate each trading day.

The Contract is available to trade each day during the TeraExchange hours of operation, subject to any applicable Clearing Venue Specifications or restrictions.
